

AmeriSus & Energy Panel Structures Team to Market ADU Kits

August 3 - Penns Park - AmeriSus the leading name in Whole Home Kits for Eco-Homes and Eco-Cottages announced today a joint marketing effort with Energy Panel Structures (EPS) a leading manufacture of pre-engineered building components designed for post frame construction and structural insulated panel (SIP) structures.

Both companies will market a mix of smaller cottage homes specifically addressing the growing Accessory Dwelling Unit marketplace. The AmeriSus ADU's are one-bedroom stand-alone eco-structures outfitted with efficient high quality systems and finishes. Often regarded as carriage homes, granny flats and in-law suites ADU's have become a popular new solution for creating affordable housing without the complexities associated with raw land development. States and cities across the nation have been changing legislation allowing ADU's to become a part of mainstream America.

Donna Kamps, CEO of AmeriSus described how, "much of this small home marketplace is being addressed with expensive specialty products looking like modified cargo containers. We've taken a fresh approach to bring truly attractive units that have been engineered as kits that can be built on site by local builders or even by homeowners looking to take on something larger than a weekend challenge. We have a product that visually fits in with the neighborhood, offers homeowners a fantastic ROI and satisfies one huge social problem. Let's face it, everybody has a relative, friend or neighbor that could benefit by living in a new home that doesn't kill the monthly budget."

Kamps went on, “SIP construction provides superior strength and energy efficiency in a form that’s quick and easy to build. Our homes can be secure and weather tight in less than a week with the structure then serving as the receiving warehouse for all the finish parts that a builder or homeowner will use to complete the home”

AmeriSus (short for American Sustainability Initiative) has been creating eco-homes for the last ten years using a kit home approach that blends design, improved constructability, procurement and logistics via a proprietary fast-track data management process, called their Ready Build™ system which allows builders to significantly reduce construction costs while providing an unmatched price/value ratio.

Energy Panel Structures (EPS) manufactures pre-engineered building components designed for post frame construction, structural insulated panels (SIP’s) and refrigerated and freezer structures via an independent dealer network of over 400 professional builders. EPS is an employee-owned company and has been manufacturing superior building components since 1981.
